The CSS Selector that I used that seemed useful was that ".card" element.

The difference between padding and margin is that margin expands or closes in the spacing in between elements similar to a box so that you can alter it in order for images or paragraphs to not be so close to each other. Padding allows spacing in between elements so that lets say in a paragraph your words are too close together, padding allows those words to have more space in between which helps with readability.

The box model helped my design by giving it its own section and making the information that was in that model stand out.

An element that overrode another selector was the ".feature" which overrode my p selector. My p selector gave a new font and a pink border for my paragraphs. Feature took over the font with a new one, a different border color and text color was turned white.

The margins and padding definitely helped my css as it was simple and increases the readability of my css.
